

```
# Step 1: Import required libraries
import numpy as np
import matplotlib.pyplot as plt
from sklearn.linear_model import LinearRegression

# Step 2: Create dataset (10 students)
cgpa = np.array([6.0, 6.5, 7.0, 7.2, 7.5, 8.0, 8.2, 8.5, 9.0, 9.2]).reshape(-1,
1)
package = np.array([3.0, 3.5, 4.0, 4.3, 4.8, 5.5, 6.0, 6.8, 7.5, 8.0])
```

```
# Step 3: Plot the dataset (Scatter Plot)
plt.scatter(cgpa, package)
plt.xlabel("CGPA")
plt.ylabel("Package (LPA)")
plt.title("CGPA vs Package Dataset")
plt.show()
```

```
# Step 4: Create and train Linear Regression model
model = LinearRegression()
model.fit(cgpa, package)
```

LinearRegression [\(i\)](#) [\(?\)](#)  
LinearRegression()

```
# Step 5: Take new CGPA input from user
new_cgpa = float(input("Enter CGPA to predict package: "))

# Step 6: Predict package
predicted_package = model.predict([[new_cgpa]])

# Step 7: Show result
print(f"Predicted Package for CGPA {new_cgpa} is: {predicted_package[0]:.2f} LPA")
```

```
Enter CGPA to predict package: 8.3
Predicted Package for CGPA 8.3 is: 6.29 LPA
```
